1 Why Is It Gaussian?

Let X be a normally distributed random variable with mean μ and variance σ^2. Let $Y = aX + b$, where a and b are non-zero real numbers. Show explicitly that Y is normally distributed with mean $a\mu + b$ and variance $a^2\sigma^2$. The PDF for the Gaussian Distribution is $\frac{1}{\sqrt{2\pi\sigma^2}}e^{-\frac{(x-\mu)^2}{2\sigma^2}}$.

2 Tails of the Gaussian

In the question we will bounds on the probability that $|X| \geq t$ where X is a Gaussian random variable with mean 0 and variance 1.

(a) Use Chebyshev's inequality to bound the probability that $|X| \geq t$ for $t \geq 1$.

(b) We will now show that it is possible to get much better bounds. Firstly, prove that:

$$\mathbb{P}[|X| \geq t] = 2 \int_t^\infty \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx$$

(c) Now, noting that when $t \geq 1$, we have:

$$\int_t^\infty \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx \leq \int_t^\infty \frac{t}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx$$

Prove a new upper bound on the probability in part (a).

(d) Why is this a better upper bound than the one in part (a)?

3 Hypothesis testing

We would like to test the hypothesis claiming that a coin is fair, i.e. $P(H) = P(T) = 0.5$. To do this, we flip the coin $n = 100$ times. Let Y be the number of heads in $n = 100$ flips of the coin. We decide to reject the hypothesis if we observe that the number of heads is less than $50 - c$ or larger than $50 + c$. However, we would like to avoid rejecting the hypothesis if it is true; we want to keep the probability of doing so less than 0.05. Please determine c. (*Hints: use the central limit theorem to estimate the probability of rejecting the hypothesis given it is actually true.*)
